Chapter 1

Introduction

The ordered-subsets expectation – maximization (OSEM) algorithm [1] is widely adopted for PET image reconstruction.

Chapter 3

Materials and Methods

The dataset used in this study consisted of T1-weighted magnetic resonance imaging (MRI) in native space and corresponding [^{18}F]-FDG positron emission tomography (PET) data from 50 subjects, obtained from the Alzheimer’s Disease Neuroimaging Initiative (ADNI) database (adni.loni.usc.edu). These subjects span three diagnostic categories: cognitive normal (cognitive normal (CN)), mild cognitive impairment (mild cognitive impairment (MCI)), and Alzheimer’s disease (Alzheimer’s Disease (AD)), with 17, 16, and 17 subjects respectively.

A FreeSurfer Usage

B Almost Done!

You may feel tired, but you're almost there! Just a little more work to go.
